NIH	National Institutes of Health
NLAAS	National Latino and Asian American Survey
NSAL	National Survey of American Life

Sociocultural variation refers to differential lived experiences linked to race, nativity, ethnicity, and cultural influences. Despite efforts to respond to calls to investigate sociocultural variation with care, sociologists of mental health have not yet devoted sufficient attention to how it can complicate and clarify our understanding of mental health status. Richer understanding of mental health status in the United States, a nation that is becoming increasingly diverse (Day, 1996; Kim, 2011; Ortmann & Guarneri, 2009), requires that scholars consider carefully the nature and consequences of sociocultural variation. For instance, race is an important predictor of exposure and vulnerability to stressful events, coping strategies, social support, and, in turn, mental health status (Gee, Delva, & Takeuchi, 2007; Kuo, 1995; Lawson, 1986; Meketom, 1983; Mossakowski, 2003; Noh, Kaspar, & Wickrama, 2007; Taylor & Turner, 2002; Yip, Gee, & Takeuchi, 2008). However, race grossly aggregates individuals, hiding variations in mental health status, and thus it must be deconstructed. If not, race will continue to mask and perhaps distort ethnic differences, nativity differences, and cultural influences. We believe it is time to move beyond an approach that categorizes, theorizes, or clinically treats members of racial groups—such as Hispanics or blacks—as homogeneous without
