Abstract

This paper highlights the public health implications of urbanization within the developing and developed countries in Asia to include a discussion on how urbanization affect on health and nutrition. The study also draws strategies from countries in Asia and South Africa which proved successful in the control of urbanization present at local, national, and global levels.

Keywords: Urbanization, health, nutrition, infectious and communicable disease, climate change

Introduction

Urbanization refers to the mass movement of populations from rural settings to urban ones and the corresponding physical changes to urban settings that result. In 2007, the United Nations Food Protection Agency estimated that by 2008 more than half of the world's population (3.3 billion people) will be living in urban areas and by 2030 this figure will increase to 5 billion people [1].

Cities are known to play multifaceted functions in our society. They are the heart of technological development and economic growth of many nations, while at the same time they serve as a vineyard for poverty, inequality, environmental hazards and sources of infectious disease [2]. As people congregate in cities, it leads to many problems, particularly for the poor. But the problems faced by the poor spill over to other city dwellers. As the trend of urbanization continues, this spillover effect increases and takes a global dimension as more and more of the world's populations get affected [3]. Some of the major health problems resulting from urbanization include poor nutrition, pollution and infectious diseases. These have direct impact on individual quality of life, while straining public health systems and resources [4].
